store-sales-data-analysis

This project focuses on analyzing retail store sales data to uncover business insights and support data-driven decision-making.

The analysis explores sales performance, customer behavior, product trends, and revenue patterns using data analytics tools and visualization techniques.

Project Objectives

- Analyze overall sales performance (Revenue, Profit, Quantity Sold).
- Identify top-performing products and categories.
- Track monthly and yearly sales trends.
- Analyze regional performance and customer segments.
- Detect patterns that help improve business strategy and forecasting.

🔧 Tools & Technologies

- Microsoft Excel (Data Cleaning & Pivot Tables)
- SQL (Data Extraction & Queries)
- Power BI (Interactive Dashboard & Visualization)
- Python (Pandas, Matplotlib) – optional if used

Key Insights

- Seasonal trends impacting sales performance.
- Best and worst performing product categories.
- Regional contribution to total revenue.
- Customer purchasing behavior analysis.

Project Structure

- data/ → Raw and cleaned datasets
- sql/ → SQL queries used for analysis
- notebooks/ → Data analysis scripts (Python)
- dashboard/ → Power BI dashboard file
- images/ → Dashboard screenshots

Results

The project provides actionable insights that can help store managers optimize inventory, improve marketing strategies, and increase profitability.
